

IN THE TITLE:

Please amend the title as --MATRIX SUBSTRATE AND
DISPLAY WHICH INPUTS SIGNAL-POLARITY INVERTING SIGNALS TO PICTURE
DATA--.

IN THE CLAIMS:

Please cancel Claims 6 and 23.

Please amend Claims 1, 5, 18 and 22 as follows:

Sub
9
A1
1. (Amended) A matrix substrate having plural
switching elements provided in matrix corresponding to
intersecting points of scanning lines and signal lines, plural
picture element electrodes connected to the switching elements,
and horizontal circuits and vertical circuits for inputting the
signals to the switching elements, [wherein] the matrix substrate
[comprises] comprising:

a horizontal scanning circuit for sampling a
picture data based on digital picture signals[,];

a latch circuit for memorizing the data
synchronously with output from the horizontal scanning
circuit[,];

a D/A converter for converting the output from the

latch circuit into analog signals[,];

plural signal transfer switches provided between
the D/A converter and the signal lines[, and];

A1 a selection circuit for selecting at least one of
the signal transfer switches; and

means for inputting signal-polarity inverting
signals together with the picture data, and for inverting the
polarity of the analog output of the D/A converter.

Claim 5, line 2, delete "constituted of".

Sub
ca
A2 18. (Amended) A liquid crystal device comprising a
matrix substrate having plural switching elements provided in
matrix corresponding to intersecting points of scanning lines and
signal lines, plural picture element electrodes connected to the
switching elements, and horizontal circuits and vertical circuits
for inputting the signals to the switching elements; a counter
substrate opposing to the matrix substrate; and a liquid crystal
material placed between the matrix substrate and the counter
substrate, [wherein] the matrix substrate [comprises] comprising:

a horizontal scanning circuit for sampling a
picture data based on digital picture signals[,];

a latch circuit for memorizing the data

synchronously with output from the horizontal scanning
circuit[,];

a D/A converter for converting the output from the
latch circuit into analog signals[,];

plural signal transfer switches connected to
output of the D/A converter[, and];

A2 a selection circuit for selecting at least one of
the signal transfer switches; and

means for inputting signal-polarity inverting
signals together with the picture data, and for inverting the
polarity of the analog output of the D/A converter.

Claim 22, lines 2-3, delete "constituted of".

[Please add new claims 38-48 as follows:]

A3 sub
G3
c
--38. A matrix substrate having plural switching
elements provided in matrix corresponding to intersecting points
of scanning lines and signal lines, plural picture element
electrodes connected to the switching elements, a horizontal
circuit for inputting the signals to the switching elements, and
a vertical circuit for driving said scanning lines, the matrix
substrate comprising:

a horizontal scanning circuit for sampling a

picture data based on digital picture signals;

a latch circuit for memorizing the data
synchronously with output from the horizontal scanning circuit;

a D/A converter for converting the output from
the latch circuit into analog signals; and

polarity inversion means for inputting, together
with the picture data, a signal polarity inversion signal and for
inverting a polarity of the analog output of said D/A converter
according to the signal polarity inversion signal.

A3 39. The matrix substrate according to claim 38,
wherein the switching element is a CMOS transistor.

40. The matrix substrate according to claim 38,
wherein the D/A converter is capable of inputting one bit more
than the bit number of the picture data bits, and the signal-
polarity inverting signal is inputted to the most significant bit
of the D/A converter.

41. The matrix substrate according to claim 38,
wherein the matrix substrate has a booster circuit for boosting
the output of the D/A converter.

42. The matrix substrate according to claim 41,
wherein the booster circuit comprises a clamp type amplifier.

Sub
C4
A3
43. A liquid crystal apparatus, comprising:
a matrix substrate having plural switching
elements provided in matrix corresponding to intersecting points
of scanning lines and signal lines, plural picture element
electrodes connected to the switching elements, a horizontal
circuit for inputting the signals to the switching elements, and
a vertical circuit for driving the signal lines;
an opposite substrate opposing said matrix
substrate; and
a liquid crystal material between said matrix
substrate and said opposite substrate,
said apparatus further comprising a horizontal
scanning circuit for sampling a picture data based on digital
picture signals, a latch circuit for memorizing the data
synchronously with output from the horizontal scanning circuit, a
D/A converter for converting the output from the latch circuit
into analog signals, and means for inputting a signal polarity
inversion signal together with the picture data, and for
inverting a polarity of the analog output of said D/A converter
according to the signal polarity inversion signal.
